Li Research Group

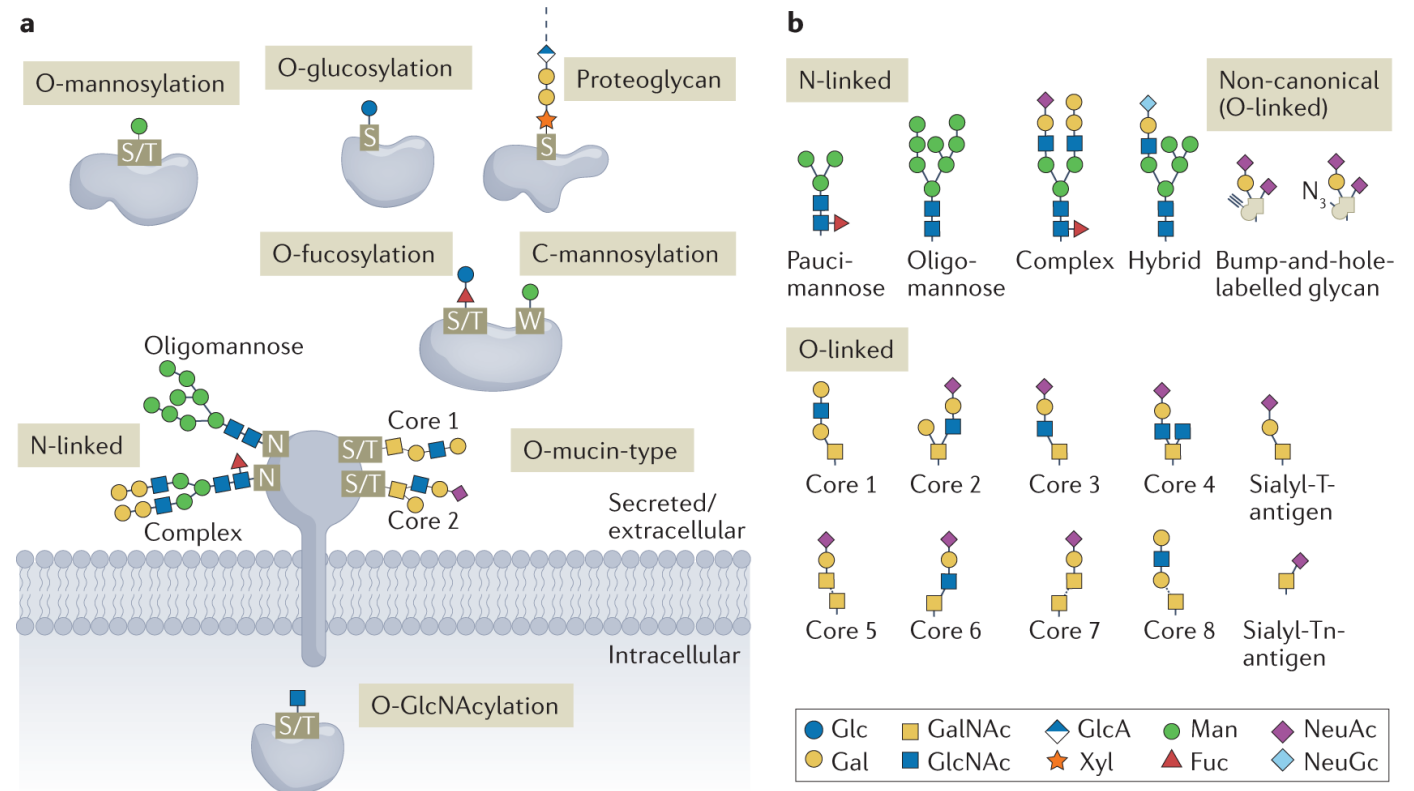

- Each year, approximately 300,000 women worldwide are diagnosed with Ovarian Cancer (OC); 180,000 succumb to this disease.
- Fifth most common cause of female cancer death; leading cause of cancer death in gynecological malignancies.
- High mortality rate is due to inadequate early detection.
  - Vague, late-occurring disease symptoms.
  - Lack of early diagnostic markers.
- Patients could have about 90% chance of cure if diagnosed in the early stages.
  - Only 30% of patients are diagnosed with stage I OC.
  - The majority are diagnosed with stage III&IV OC.

# Ovarian Cancer - Glycoproteomics

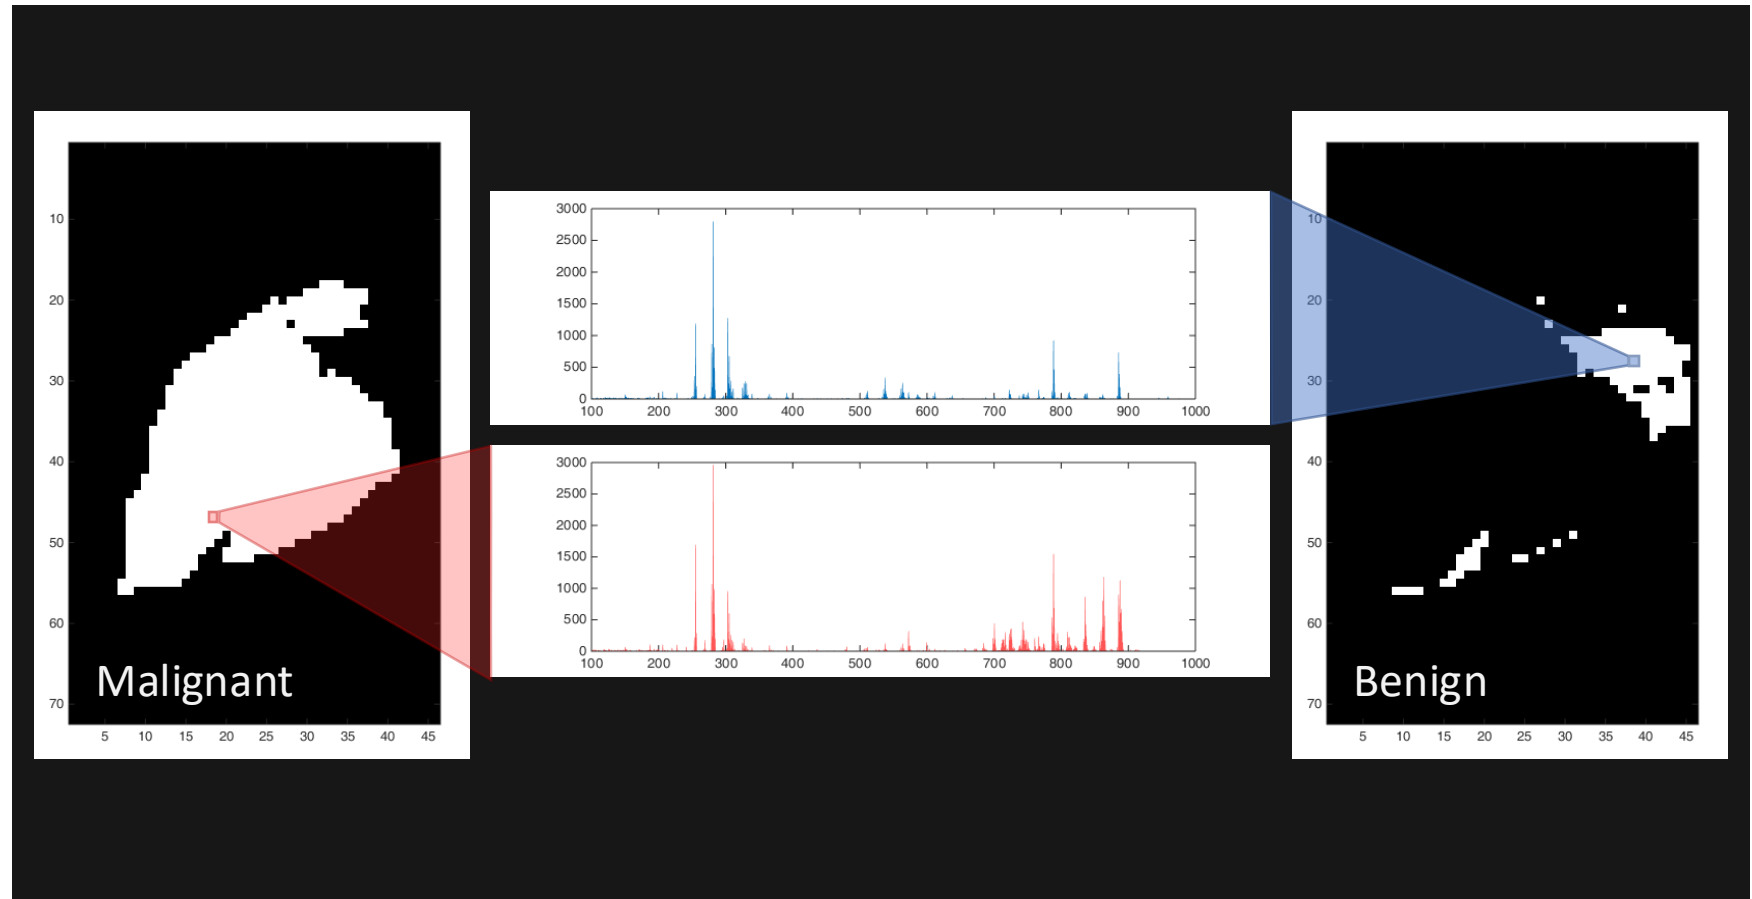

- Protein glycosylation is one of the post-translational modifications (PTMs) that impact a huge number of biological processes.
- Dysregulation of glycosylation is associated with numerous diseases, such as cancers and Alzheimer's disease.

1. Bagdonaite, I. *et al.* Glycoproteomics. *Nat Rev Methods Primers* **2022**, 2 (1), 1–29.
2. Grabarics, M.; Lettow, M.; Kirschbaum, C.; Greis, K.; Manz, C.; Pagel, K. Mass Spectrometry-Based Techniques to Elucidate the Sugar Code. *Chem. Rev.* **2022**, 122 (8), 7840–7908.

- **Hypothesis:** Protein glycosylation is dysregulated in OC tumor tissues compared to adjacent normal tissues; thus, species detected in malignant tumor regions and benign tumor regions will be different. MSI can serve as a tool to interrogate and visualize the differences.

Courtesy of Ying-Chen Huang

- Intact glycoproteins are hard to be directly profiled.
  - Large molecules are difficult to be ionized.
  - Relatively low abundant compared to others.
- Glycans and peptides are better starting points to reveal the structures and spatial localization of glycoproteins.
  - The combinational uses of glycosidases and proteases to expand the chemical information obtained from MSI.

- Sequential enzymatic digestion to release N-glycans/tryptic peptides to expand chemical coverage on MALDI MSI for biomarker discovery of ovarian cancer.
- On-tissue AP-MALDI DDA-MS<sup>2</sup> characterization of glycan compositions and peptide sequences.
- By combining both LC-MS/MS and AP-MALDI DDA-MS<sup>2</sup>, the identifications can be achieved more accurately and confidently *in-situ*.
